Homework Assignment 1

Making maps with `tmap`

Cancer Alley in Louisiana, USA

"Cancer Alley" is an 85-mile stretch of land along the Mississippi River in Louisiana where about 25% of the United States' petroleum products are produced. Due to air pollution from these plants, residents in the area suffer from " increased rates and risks of maternal, reproductive, and newborn health harms; respiratory illnesses; and cancer" (Public Health On Call, Johns Hopkins Bloomberg School). This has been a well-documented environmental injustice issue since the 1980s.

Project Objective: Visualize cancer risk in Louisiana resulting from industry air pollution.

Load libraries and import data

```
library(tidyverse)
library(sf)
library(here)
library(stars)
library(tmap)
library(viridisLite)

# read in geodatabase of EJScreen data at the Census Block Group level
ejscreen <- sf::st_read(here::here("data", "ejscreen","EJSCREEN_2023_BG_StatePct_with_AS_CNM
```

```
Reading layer `EJSCREEN_StatePctiles_with_AS_CNMI_GU_VI' from data source
  `/home/kellymorgan/meds/eds223-HW1/data/ejscreen/EJSCREEN_2023_BG_StatePct_with_AS_CNMI_GU_
  using driver `OpenFileGDB'
Simple feature collection with 243021 features and 223 fields
Geometry type: MULTIPOLYGON
Dimension:     XY
Bounding box:  xmin: -19951910 ymin: -1617130 xmax: 16259830 ymax: 11554350
Projected CRS: WGS 84 / Pseudo-Mercator
```

Filter data

Counties, or *parishes*, along "Cancer Alley" include: Ascension Parish, St. Charles Parish, St. James Parish, St. John the Baptist Parish, Iberville Parish, West Baton Rouge Parish, East Baton Rouge Parish, Jefferson Parish, and Orleans Parish.

```
# filter to a state you are interested in
louisiana <- ejscreen %>%
  dplyr::filter(ST_ABBREV == "LA")

# filter to EJ of interest
cancer <- louisiana %>%
  dplyr::filter(CANCER >= 50)

# filter to a county you are interested in
```

```
river_parish <- louisiana %>%
  dplyr::filter(CNTY_NAME %in% c("Ascension Parish", "St. Charles Parish", "St. James Parish
```

Aggregate data

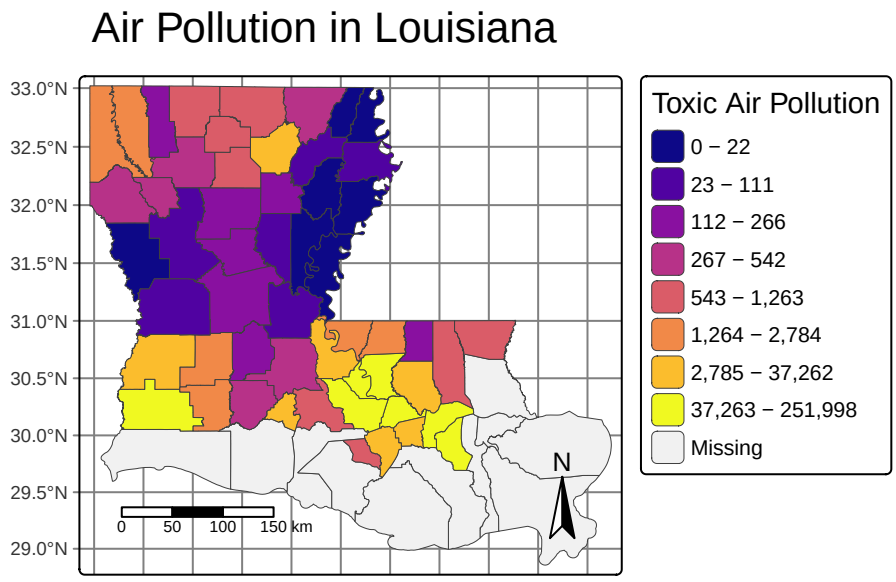

Aggregating the dataset by county allows for visualization of each metrics by county below.

```
# find the average values for all variables within counties
louis_counties <- aggregate(louisiana, by = list(louisiana$CNTY_NAME), FUN = mean) |> rename

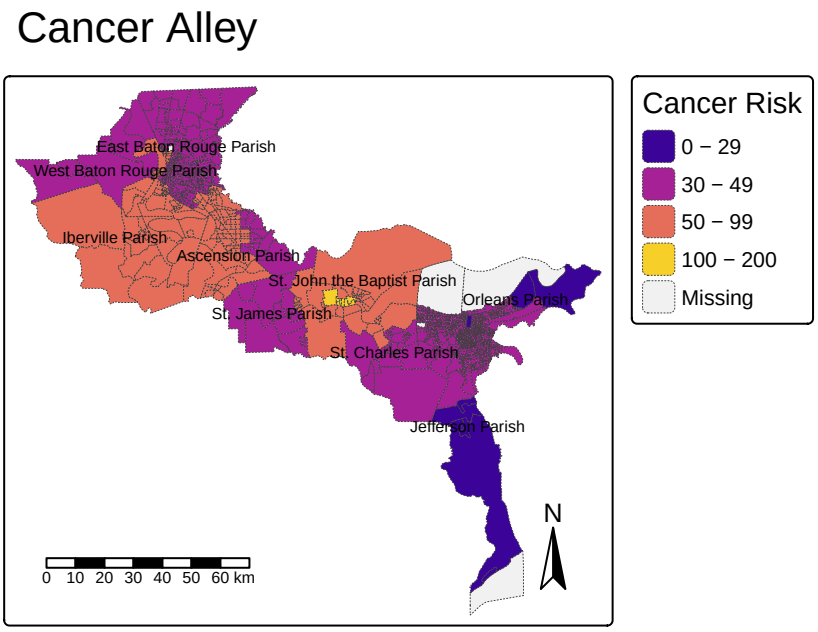

river_counties <- aggregate(river_parish, by = list(river_parish$CNTY_NAME), FUN = mean) |> r
```

Visualize data

```
county_health <- tm_shape(louis_counties) +
    tm_graticules() +
    tm_polygons(
        fill = "RSEI_AIR",
        fill.scale = tm_scale(n = 8, style = "quantile", values = "plasma"),
        fill.legend = tm_legend(title = "Toxic Air Pollution"),
        lwd = 0.5
        ) +
    tm_scalebar(
        position = "bottom"
        ) +
    tm_compass() +
    tm_title("Air Pollution in Louisiana")
county_health
```

```
river_health <- tm_shape(river_parish) +
    tm_polygons(
        fill = "CANCER",
        fill.scale = tm_scale_intervals(breaks = c(0, 30, 50, 100, 200), values = 'plasma'),
        fill.legend = tm_legend(
            title = "Cancer Risk"),
        lty = 'dashed',
        lwd = 0.2
    ) +
    tm_scalebar(
        position = "bottom"
    ) +
    tm_compass() +
    tm_title("Cancer Alley") +
tm_shape(river_counties) +
    tm_text(
        text = "County_Label",
        size = 0.5
    )
river_health
```

Map Interpretations

The "Toxic Air Pollution" map clearly demonstrates heightened air pollution around the River Parishes in Louisiana along the Mississippi (visualized in bright yellow). Two toxic chemicals of note include ethylene oxide and chloroprene, which Johns Hopkins researchers have identified as byproducts of foodstuff sterilization and neoprene production in the area. The River Parishes are home to the only facility in the U.S. that makes neoprene, which one researcher notes it right next to an elementary school (Nachman and DeCarlo).

Taking a closer look at the River Parishes, also known as "Cancer Alley," cancer risk appears to be over 40 units and upwards of 200 units in some regions. The Ascension, St. John the Baptist, and Iberville Parishes appear to have the highest cancer risk overall. In an article from 2023, the EPA cited cancer risk in the area as seven times the national average, with St. John the Baptist Parish having the highest risk in the country (Amorebieta et al 2023). Johns Hopkins Bloomberg School for Public Health continues to conduct research on the extreme environmental injustice and looks for treatments to the diseases resulting from the pollution.
